

HIGH GRADES FROM GOLDEN LION DRILLING ESTABLISH A BRIGHT OUTLOOK FOR 2022

After several seasons of searching, in our final 3 holes of the 2021 field season we discovered our first high-grade gold-silver domain within the large-scale footprint of the fault-bounded epithermal-style GL1 Main Zone, located on our Golden Lion property in the rich geology of northwestern B.C. The results included the highest grades of gold, silver, zinc and lead ever achieved in drilling on the property. The initial high-grade domain is open for expansion in all directions, and the nature of these systems suggests a high likelihood of finding more as we explore the system below and along strike. Join us as we target high grades in our high-priority follow-up drilling in the approaching 2022 field season.
